## **General Nematology** Armand Maggenti

This text is an overall view of nematology because I believe the science should be treated as a unified discipline. The differences in the biological habits of nematodes do not justify the separation of plant nematologists and animal nematologists, since the separation is not a reflection of any differences inherent to nematodes. Therefore, the book is arranged with a format that in the beginning chapters illustrates the similarities and sequence of development of morphological characters among nematodes regardless of their biological habits. The later chapters illustrate the integration of the evolutionary development of the parasitic habit from related free-living forms. Nematology is probably the last major discipline to establish its independence from the parent science of zoology. This natural evolution of nematology has occurred because of the overwhelming accumulation of sophisticated information and research that reflects the unique relationships of nematodes to other forms of plant and animal life as well as their relationships in other facets of the environment. Nematodes are invertebrate animals that, like insects, are unusual in their great numbers and varieties, their small size (generally microscopic), their high degree of internal organization, and their virtually ubiquitous distribution. They occupy almost every ecological niche, often causing disease of humans, other animals, and plants. These activities often result in debility, death, or in the impairment and loss of food supply with consequent loss to producers and consumers.
